Our method of seperation

- By verified computations (implemented in SnapPy by M. Goerner)

With verified computation, the canonical triangulation produced is a complete invariant of cusped hyperbolic 3-manifolds.

The price of verified computation:

The price of verified computation:

- Need to do algebra on the number field of shapes.

The price of verified computation:

- Need to do algebra on the number field of shapes.

BoGwang Jeon, 2014

$$\deg\{\text{shape field}\} \propto \frac{1}{\min\{\text{length of geodesics}\}}$$

The price of verified computation:

- Need to do algebra on the number field of shapes.

BoGwang Jeon, 2014

$$\deg\{\text{shape field}\} \propto \frac{1}{\min\{\text{length of geodesics}\}}$$

The verified computation of 16/608,918 of orientable eligible triangulations ended up OOM (with 60GB RAM).

The price of verified computation:

- Need to do algebra on the number field of shapes.

BoGwang Jeon, 2014

$$\deg\{\text{shape field}\} \propto \frac{1}{\min\{\text{length of geodesics}\}}$$

The verified computation of 16/608,918 of orientable eligible triangulations ended up OOM (with 60GB RAM).

- Using (volume[:60], H_1), the 16 triangulations were separated from other triangulations ($\leq$ 10 tet.) and into 6 groups;

L. 2025

There are precisely 150,730 orientable cusped hyperbolic 3-manifolds triangulable by a minimal of 10 tetrahedra.

Table of Contents

Census of exceptional Dehn fillings

Exceptional Dehn filling

A Dehn filling on a cusped hyperbolic 3-manifold is *exceptional* if the resulting manifold is not hyperbolic.

Census of exceptional Dehn fillings

Exceptional Dehn filling

A Dehn filling on a cusped hyperbolic 3-manifold is *exceptional* if the resulting manifold is not hyperbolic.

6-Theorem (Agol, 2000)

Let M be a 1-cusped hyperbolic 3-manifold. If a slope (p, q) has length larger than 6, then $M(p, q)$ is hyperbolic.

Census of exceptional Dehn fillings

Exceptional Dehn filling

A Dehn filling on a cusped hyperbolic 3-manifold is *exceptional* if the resulting manifold is not hyperbolic.

6-Theorem (Agol, 2000)

Let M be a 1-cusped hyperbolic 3-manifold. If a slope (p, q) has length larger than 6, then $M(p, q)$ is hyperbolic.

Corollary

There are only finitely many exceptional Dehn fillings on a 1-cusped hyperbolic 3-manifold.

Dunfield, 2019

There are precisely 205,822 exceptional Dehn fillings on 1-cusped hyperbolic 3-manifolds triangulable by no more than 9 tetrahedra.

Dunfield, 2019

There are precisely 205,822 exceptional Dehn fillings on 1-cusped hyperbolic 3-manifolds triangulable by no more than 9 tetrahedra.

L., 2025

There are precisely 439,898 exceptional Dehn fillings on 1-cusped hyperbolic 3-manifolds triangulable by a minimal of 10 tetrahedra.

L., 2025

(In progress) Classification of each filling & Verify conjectures

A conjecture on Thurston norm:

A conjecture on Thurston norm:

Conjecture (Dunfield-Friedl-Jackson, 2024)

For any cusped hyperbolic 3-manifold M with $b_1(M) = 1$,

$$x(M) = \frac{1}{2} \deg \tau_{2,\rho}(M)$$

A conjecture on Thurston norm:

Conjecture (Dunfield-Friedl-Jackson, 2024)

For any cusped hyperbolic 3-manifold M with $b_1(M) = 1$,

$$x(M) = \frac{1}{2} \deg \tau_{2,\rho}(M)$$

- In the 10-tet census: 143,919 manifolds with $b_1(M) = 1$

A conjecture on Thurston norm:

Conjecture (Dunfield-Friedl-Jackson, 2024)

For any cusped hyperbolic 3-manifold M with $b_1(M) = 1$,

$$x(M) = \frac{1}{2} \deg \tau_{2,\rho}(M)$$

- In the 10-tet census: 143,919 manifolds with $b_1(M) = 1$
- Successfully computed $x(M)$ for all but 21 of them

A conjecture on Thurston norm:

Conjecture (Dunfield-Friedl-Jackson, 2024)

For any cusped hyperbolic 3-manifold M with $b_1(M) = 1$,

$$x(M) = \frac{1}{2} \deg \tau_{2,\rho}(M)$$

- In the 10-tet census: 143,919 manifolds with $b_1(M) = 1$
- Successfully computed $x(M)$ for all but 21 of them
- Equality holds for all the computed ones
